--

All text, within the **landscape** environment is rotated through 90 degrees. The environment may span several pages. It works well with, and was originally created for, use with **longtable** to produce long wide tables.

All the work is done by the **graphics** package, the trick is to call it at the right place in the output routine to rotate the current page before the page head and foot are added.

1 (\*package)

Here is what Scott Pakin wrote about the **pdftex** option:

I've made a minor improvement to **lscape.dtx** that I'd like to share with the world. My addition makes **lscape** rotate the PDF "paper" – not just the text on the page – when given the "pdftex" option. (Naturally, this works only with **pdfLaTeX**.) The result is that the text is viewable online without the reader having to rotate his/her head 90 degrees. The document still prints normally.
